Abstract—This book provides solutions to the Linear Algebra book by Hoffman and Kunze.

1 LINEAR EQUATIONS

1.1 Fields and Linear Equations

1.1.1. Verify that the set of complex numbers numbers described in the form of c where x and y are rational is a sub-field of \mathbb{C} .

Solution: Lets consider the set $S = \{x + y\sqrt{2}, x, y \in \mathbb{Q}\}$, $S \subset \mathbb{C}$ We must verify that S meets the following two conditions:

$$0, 1 \in S \quad (1.1.1.1)$$

$$a, b \in S, a + b, -a, ab, a^{-1} \in S \quad (1.1.1.2)$$

Throughout let

$$a = x + y\sqrt{2}, b = w + z\sqrt{2} \quad (1.1.1.3)$$

If

a)

$$x = 0, y = 0 \in \mathbb{Q}, a = 0 + \sqrt{2}.0 = 0, 0 \in S \quad (1.1.1.4)$$

b)

$$x = 1, y = 0, a = 1 + \sqrt{2}.0 = 1, 1 \in S \quad (1.1.1.5)$$

c)

$$a + b = x + y\sqrt{2} + w + z\sqrt{2} = b + a \quad (1.1.1.6)$$

d)

$$-a = -x - y\sqrt{2}, x, y \in \mathbb{Q} \text{ so } -x, -y \in \mathbb{Q}, a \in S \quad (1.1.1.7)$$

e)

$$ab = (x + y\sqrt{2})(w + z\sqrt{2}) = ba, ab \in S \quad (1.1.1.8)$$

f)

$$a^{-1}a = (x + y\sqrt{2})^{-1}(x + y\sqrt{2}) = 1, a^{-1} \in S \quad (1.1.1.9)$$

Hence (1.1.1.1), (1.1.1.2) is verified. Therefore by considering the (1.1.1.1) and (1.1.1.2) we

*The author is with the Department of Electrical Engineering, Indian Institute of Technology, Hyderabad 502285 India e-mail: gadepall@iith.ac.in. All content in this manual is released under GNU GPL. Free and open source.

can say set complex numbers of given form $x + y\sqrt{2}$ is subfield of \mathbb{C} .

1.1.2. Let \mathbb{F} be the field of complex numbers. Are the following two systems of linear equations equivalent? If so, express each equation in each system as a linear combination of the equations in the other system.

$$\begin{aligned} x_1 - x_2 &= 0 \\ 2x_1 + x_2 &= 0 \end{aligned}$$

and

$$\begin{aligned} 3x_1 + x_2 &= 0 \\ x_1 + x_2 &= 0 \end{aligned}$$

Solution: The given system of linear equations can be written as,

$$\mathbf{A}\mathbf{x} = \mathbf{0} \quad (1.1.2.1)$$

$$\Rightarrow \begin{pmatrix} 1 & -1 \\ 2 & 1 \end{pmatrix} \mathbf{x} = \mathbf{0} \quad (1.1.2.2)$$

$$\mathbf{B}\mathbf{x} = \mathbf{0} \quad (1.1.2.3)$$

$$\Rightarrow \begin{pmatrix} 3 & 1 \\ 1 & 1 \end{pmatrix} \mathbf{x} = \mathbf{0} \quad (1.1.2.4)$$

Now we can obtain \mathbf{B} from matrix \mathbf{A} by performing elementary row operations given as,

$$\mathbf{B} = \mathbf{CA} \quad (1.1.2.5)$$

$$\begin{pmatrix} 3 & 1 \\ 1 & 1 \end{pmatrix} = \mathbf{C} \begin{pmatrix} 1 & -1 \\ 2 & 1 \end{pmatrix} \quad (1.1.2.6)$$

where \mathbf{C} is product of elementary matrices given as,

$$\begin{aligned} \mathbf{C} &= (\mathbf{E}_7\mathbf{E}_6\mathbf{E}_5\mathbf{E}_4\mathbf{E}_3\mathbf{E}_2\mathbf{E}_1) \\ &= \begin{pmatrix} 1 & 0 \\ \frac{1}{3} & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & \frac{2}{3} \end{pmatrix} \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 3 & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & \frac{1}{3} \end{pmatrix} \begin{pmatrix} 1 & 0 \\ -2 & 1 \end{pmatrix} \\ &= \begin{pmatrix} \frac{1}{3} & \frac{4}{3} \\ -\frac{1}{3} & \frac{2}{3} \end{pmatrix} \quad (1.1.2.7) \end{aligned}$$

Now, performing elementary operations on the right side of \mathbf{A} we obtain matrix \mathbf{B} given as,

$$\mathbf{B} = \mathbf{AP} \quad (1.1.2.8)$$

$$\begin{pmatrix} 3 & 1 \\ 1 & 1 \end{pmatrix} = \begin{pmatrix} 1 & -1 \\ 2 & 1 \end{pmatrix} \mathbf{P} \quad (1.1.2.9)$$

where, \mathbf{P} is product of elementary matrices

given by,

$$\begin{aligned} \mathbf{P} &= (\mathbf{E}_1\mathbf{E}_2\mathbf{E}_3\mathbf{E}_4\mathbf{E}_5) \\ &= \begin{pmatrix} 1 & 0 \\ -2 & 1 \end{pmatrix} \begin{pmatrix} \frac{1}{3} & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 2 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 2 & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 1 & 1 \end{pmatrix} \\ &= \begin{pmatrix} \frac{4}{3} & \frac{2}{3} \\ -\frac{5}{3} & -\frac{1}{3} \end{pmatrix} \quad (1.1.2.10) \end{aligned}$$

Similarly, \mathbf{A} can be obtained from matrix \mathbf{B} from (1.1.2.5) as,

$$\mathbf{A} = \mathbf{C}^{-1}\mathbf{B} \quad (1.1.2.11)$$

$$\begin{pmatrix} 1 & -1 \\ 2 & 1 \end{pmatrix} = \mathbf{C}^{-1} \begin{pmatrix} 3 & 1 \\ 1 & 1 \end{pmatrix} \quad (1.1.2.12)$$

Matrix \mathbf{C} is product of elementary matrices and hence invertible and is given as,

$$\begin{aligned} \mathbf{C}^{-1} &= (\mathbf{E}_1^{-1}\mathbf{E}_2^{-1}\mathbf{E}_3^{-1}\mathbf{E}_4^{-1}\mathbf{E}_5^{-1}\mathbf{E}_6^{-1}\mathbf{E}_7^{-1}) \\ &= \begin{pmatrix} 1 & 0 \\ 2 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & \frac{3}{2} \end{pmatrix} \begin{pmatrix} 1 & -1 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} \frac{1}{3} & 0 \\ 0 & 1 \end{pmatrix} \\ &\quad \begin{pmatrix} 1 & -1 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & \frac{3}{2} \end{pmatrix} \begin{pmatrix} 1 & 0 \\ -\frac{1}{3} & 1 \end{pmatrix} \\ &= \begin{pmatrix} 1 & -2 \\ \frac{1}{2} & \frac{1}{2} \end{pmatrix} \quad (1.1.2.13) \end{aligned}$$

Matrix \mathbf{A} can also be obtained from (1.1.2.8) given as,

$$\mathbf{A} = \mathbf{BP}^{-1} \quad (1.1.2.14)$$

$$\begin{pmatrix} 1 & -1 \\ 2 & 1 \end{pmatrix} = \begin{pmatrix} 3 & 1 \\ 1 & 1 \end{pmatrix} \mathbf{P}^{-1} \quad (1.1.2.15)$$

where,

$$\begin{aligned} \mathbf{P}^{-1} &= (\mathbf{E}_5^{-1}\mathbf{E}_4^{-1}\mathbf{E}_3^{-1}\mathbf{E}_2^{-1}\mathbf{E}_1^{-1}) \\ &= \begin{pmatrix} 1 & 0 \\ -1 & 1 \end{pmatrix} \begin{pmatrix} \frac{1}{2} & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & -2 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 3 & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 2 & 1 \end{pmatrix} \\ &= \begin{pmatrix} -\frac{1}{2} & -1 \\ \frac{5}{2} & 2 \end{pmatrix} \quad (1.1.2.16) \end{aligned}$$

Thus (1.1.2.4) can be obtained from (1.1.2.2) by multiplying it with matrix \mathbf{C} , and by inverse row operations (1.1.2.2) can be obtained back from (1.1.2.4) since \mathbf{C} is product of elementary matrices and hence invertible.

Thus the two given homogeneous systems are row equivalent.

Now writing equations in matrix-vector form

as,

$$3x_1 + x_2 = \begin{pmatrix} 3 & 1 \end{pmatrix} \mathbf{x} \quad (1.1.2.17)$$

$$\Rightarrow \begin{pmatrix} 3 & 1 \end{pmatrix} \mathbf{x} = \frac{1}{3} \begin{pmatrix} 1 & -1 \end{pmatrix} \mathbf{x} + \frac{4}{3} \begin{pmatrix} 2 & 1 \end{pmatrix} \mathbf{x} \quad (1.1.2.18)$$

$$x_1 + x_2 = \begin{pmatrix} 1 & 1 \end{pmatrix} \mathbf{x} \quad (1.1.2.19)$$

$$\Rightarrow \begin{pmatrix} 1 & 1 \end{pmatrix} \mathbf{x} = \frac{-1}{3} \begin{pmatrix} 1 & -1 \end{pmatrix} \mathbf{x} + \frac{2}{3} \begin{pmatrix} 2 & 1 \end{pmatrix} \mathbf{x} \quad (1.1.2.20)$$

(1.1.2.18), (1.1.2.20) is same as multiplying \mathbf{C} with \mathbf{A} as it takes the linear combination of each rows of matrix \mathbf{A} i.e, (1.1.2.6)

$$x_1 - x_2 = \begin{pmatrix} 1 & -1 \end{pmatrix} \mathbf{x} \quad (1.1.2.21)$$

$$\Rightarrow \begin{pmatrix} 1 & -1 \end{pmatrix} \mathbf{x} = (1) \begin{pmatrix} 3 & 1 \end{pmatrix} \mathbf{x} + (-2) \begin{pmatrix} 1 & 1 \end{pmatrix} \mathbf{x} \quad (1.1.2.22)$$

$$2x_1 + x_2 = \begin{pmatrix} 2 & 1 \end{pmatrix} \mathbf{x} \quad (1.1.2.23)$$

$$\Rightarrow \begin{pmatrix} 2 & 1 \end{pmatrix} \mathbf{x} = \frac{1}{2} \begin{pmatrix} 3 & 1 \end{pmatrix} \mathbf{x} + \frac{1}{2} \begin{pmatrix} 1 & 1 \end{pmatrix} \mathbf{x} \quad (1.1.2.24)$$

(1.1.2.22), (1.1.2.24) is same as multiplying \mathbf{C}^{-1} with \mathbf{B} as it takes the linear combination of each rows of matrix \mathbf{B} i.e, (1.1.2.12)

Thus each equation in each system can be expressed as a linear combination of the equations in the other system when they are equivalent.

1.1.3. Are the following two systems of linear equations equivalent?

$$\begin{aligned} -x_1 + x_2 + 4x_3 &= 0 \\ x_1 + 3x_2 + 8x_3 &= 0 \\ \frac{1}{2}x_1 + x_2 + \frac{5}{2}x_3 &= 0 \end{aligned} \quad (1.1.3.1)$$

Solution:

$$\begin{aligned} x_1 - x_3 &= 0 \\ x_2 + 3x_3 &= 0 \end{aligned} \quad (1.1.3.2)$$

System of linear equations in (1.1.3.1) can be

expressed in matrix form as,

$$\mathbf{A}\mathbf{x} = 0 \quad (1.1.3.3)$$

$$\begin{pmatrix} -1 & 1 & 4 \\ 1 & 3 & 8 \\ \frac{1}{2} & 1 & \frac{5}{2} \end{pmatrix} \mathbf{x} = 0 \quad (1.1.3.4)$$

System of linear equations in (1.1.3.2) can be expressed in matrix form as,

$$\mathbf{B}\mathbf{x} = 0 \quad (1.1.3.5)$$

$$\begin{pmatrix} 1 & 0 & -1 \\ 0 & 1 & 3 \end{pmatrix} \mathbf{x} = 0 \quad (1.1.3.6)$$

Two system of linear equations are equivalent if one system can be expressed as a linear combination of other system.

Matrix \mathbf{B} can be obtained from matrix \mathbf{A} as,

$$\mathbf{B} = \mathbf{C}\mathbf{A} \quad (1.1.3.7)$$

$$\begin{pmatrix} 1 & 0 & -1 \\ 0 & 1 & 3 \end{pmatrix} = \mathbf{C} \begin{pmatrix} -1 & 1 & 4 \\ 1 & 3 & 8 \\ \frac{1}{2} & 1 & \frac{5}{2} \end{pmatrix} \quad (1.1.3.8)$$

$$\mathbf{C} = \begin{pmatrix} -1 & 1 & -2 \\ \frac{1}{2} & -\frac{1}{2} & 2 \end{pmatrix} \quad (1.1.3.9)$$

Now, writing equations in matrix-vector form,

$$x_1 - x_3 = \begin{pmatrix} 1 & 0 & -1 \end{pmatrix} \mathbf{x}$$

$$\begin{aligned} \Rightarrow \begin{pmatrix} 1 & 0 & -1 \end{pmatrix} \mathbf{x} &= -1 \begin{pmatrix} -1 & 1 & 4 \end{pmatrix} \mathbf{x} \\ &+ 1 \begin{pmatrix} 1 & 3 & 8 \end{pmatrix} \mathbf{x} - 2 \begin{pmatrix} \frac{1}{2} & 1 & \frac{5}{2} \end{pmatrix} \mathbf{x} \end{aligned} \quad (1.1.3.10)$$

$$x_2 + 3x_3 = \begin{pmatrix} 0 & 1 & 3 \end{pmatrix} \mathbf{x}$$

$$\begin{aligned} \Rightarrow \begin{pmatrix} 0 & 1 & 3 \end{pmatrix} \mathbf{x} &= \frac{1}{2} \begin{pmatrix} -1 & 1 & 4 \end{pmatrix} \mathbf{x} \\ &- \frac{1}{2} \begin{pmatrix} 1 & 3 & 8 \end{pmatrix} \mathbf{x} + 2 \begin{pmatrix} \frac{1}{2} & 1 & \frac{5}{2} \end{pmatrix} \mathbf{x} \end{aligned} \quad (1.1.3.11)$$

Equations (1.1.3.10) and (1.1.3.11) is same as multiplying \mathbf{C} with \mathbf{A} which is the linear combination of rows of matrix \mathbf{A} .

Thus each equation in second system can be expressed as linear combination of the equations in first system.

Therefore, the two system of linear equations are equivalent.

1.1.4. Let \mathbb{F} be the field of complex numbers. Are the following two systems of linear equations

equivalent? If so, express each equation in each system as a linear combination of equations in other system. First system of equations:

$$2x_1 + (-1 + i)x_2 + x_4 = 0 \quad (1.1.4.1)$$

$$3x_2 - 2ix_3 + 5x_4 = 0 \quad (1.1.4.2)$$

The second system of equations:

$$(1 + \frac{i}{2})x_1 + 8x_2 - ix_3 - x_4 = 0 \quad (1.1.4.3)$$

$$\frac{2}{3}x_1 - \frac{1}{2}x_2 + x_3 + 7x_4 = 0 \quad (1.1.4.4) \quad 1.1.5.$$

Solution: Let \mathbf{R}_1 and \mathbf{R}_2 be the reduced row echelon forms of the augmented matrices of the following systems of homogeneous equations respectively.

$$\mathbf{A}\mathbf{X} = \mathbf{0} \quad (1.1.4.5)$$

$$\mathbf{B}\mathbf{X} = \mathbf{0} \quad (1.1.4.6)$$

Where \mathbf{A} and \mathbf{B} as follows

$$\mathbf{A} = \begin{pmatrix} 2 & -1+i & 0 & 1 \\ 0 & 3 & -2i & 5 \end{pmatrix} \quad (1.1.4.7)$$

$$\mathbf{B} = \begin{pmatrix} 1+\frac{i}{2} & 8 & -i & -1 \\ \frac{2}{3} & \frac{-1}{2} & 1 & 7 \end{pmatrix} \quad (1.1.4.8)$$

On performing elementary row operations on (1.1.4.7),

$$\mathbf{R}_1 = \mathbf{C}\mathbf{A} \quad (1.1.4.9)$$

where \mathbf{C} is the product of all elementary matrices. Reducing the first system of linear equations, we get,

$$\mathbf{C} = \begin{pmatrix} 1 & \frac{1-i}{2} \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & \frac{1}{3} \end{pmatrix} \begin{pmatrix} \frac{1}{2} & 0 \\ 0 & 1 \end{pmatrix} \quad (1.1.4.10)$$

$$\mathbf{R}_1 = \begin{pmatrix} 1 & 0 & \frac{-1-i}{3} & \frac{4}{3} - \frac{5i}{6} \\ 0 & 1 & \frac{-2i}{3} & \frac{5}{3} \end{pmatrix} \quad (1.1.4.11)$$

On performing elementary row operations on (1.1.4.8),

$$\mathbf{R}_2 = \mathbf{D}\mathbf{A} \quad (1.1.4.12)$$

where \mathbf{D} is the product of all elementary matrices. Reducing the second system of linear equations, we get,

$$\mathbf{D} = \begin{pmatrix} \frac{4}{5}(1 - \frac{i}{2}) & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ \frac{-2}{3} & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & \frac{-6(143+43i)}{4909} \end{pmatrix} \begin{pmatrix} 1 & \frac{16(-2+i)}{5} \\ 0 & 1 \end{pmatrix} \quad (1.1.4.13)$$

$$\mathbf{R}_2 = \begin{pmatrix} 1 & 0 & \frac{6702}{4909} - \frac{708i}{4909} & \frac{46620}{4909} - \frac{1998i}{4909} \\ 0 & 1 & \frac{-2(441+472i)}{4909} & \frac{-2(3283+1332i)}{4909} \end{pmatrix} \quad (1.1.4.14)$$

From the equations (1.1.4.11) and (1.1.4.14), we can say that

$$\mathbf{R}_1 \neq \mathbf{R}_2 \quad (1.1.4.15)$$

Hence the given systems of linear equations are not equivalent.

Let \mathbb{F} be a set which contains exactly two elements, 0 and 1. Define an addition and multiplication by tables. Verify that the set \mathbb{F} ,

$$\begin{array}{c|c|c} + & 0 & 1 \\ \hline 0 & 0 & 1 \\ 1 & 1 & 0 \end{array}$$

$$\begin{array}{c|c|c} \cdot & 0 & 1 \\ \hline 0 & 0 & 0 \\ 1 & 0 & 1 \end{array}$$

together with these two operations, is a field.

Solution:

To prove that $(\mathbb{F}, +, \cdot)$ is a field we need to satisfy the following,

a) $+$ and \cdot should be closed

- For any a and b in \mathbb{F} , $a+b \in \mathbb{F}$ and $a \cdot b \in \mathbb{F}$. For example $0+0=0$ and $0 \cdot 0=0$.

b) $+$ and \cdot should be commutative

- For any a and b in \mathbb{F} , $a+b = b+a$ and $a \cdot b = b \cdot a$. For example $0+1=1+0$ and $0 \cdot 1=1 \cdot 0$.

c) $+$ and \cdot should be associative

- For any a and b in \mathbb{F} , $a+(b+c) = (a+b)+c$ and $a \cdot (b \cdot c) = (a \cdot b) \cdot c$. For example $0+(1+0)=(0+1)+0$ and $0 \cdot (1 \cdot 0)=(0 \cdot 1) \cdot 0$.

d) $+$ and \cdot operations should have an identity element

- If we perform $a + 0$ then for any value of a from \mathbb{F} the result will be a itself. Hence 0 is an identity element of $+$ operation. If we perform $a \cdot 1$ then for any value of a from \mathbb{F} the result will be a itself. Hence 1 is an identity element of \cdot operation.

e) $\forall a \in \mathbb{F}$ there exists an additive inverse

- For additive inverse to exist, $\forall a$ in \mathbb{F} $a+(-a)=0$. For example. $1-1=0$ and $0-0=0$.

f) $\forall a \in \mathbb{F}$ such that a is non zero there exists a multiplicative inverse

- For multiplicative inverse to exist, $\forall a$ such that a is non zero in \mathbb{F} , $a \cdot a^{-1} = 1$. For example $1 \cdot 1^{-1} = 1$.

g) $+$ and \cdot should hold distributive property

- For any a, b and c in \mathbb{F} the property $a \cdot (b+c) = a \cdot b + a \cdot c$ should always hold true. For example $0 \cdot (1+1) = 0 \cdot 1 + 0 \cdot 1$.

Since the above properties are satisfied we can say that $(\mathbb{F}, +, \cdot)$ is a field.

1.1.6. Prove that if two homogenous systems of linear equations in two unknowns have the same solutions, then they are equivalent.

Solution: Let the two systems of homogenous equations be

$$\mathbf{Ax} = \mathbf{0} \quad (1.1.6.1)$$

$$\mathbf{By} = \mathbf{0} \quad (1.1.6.2)$$

We can write

$$\mathbf{CAx} = \mathbf{0} \quad (1.1.6.3)$$

$$\mathbf{DBy} = \mathbf{0} \quad (1.1.6.4)$$

where \mathbf{C} and \mathbf{D} are product of elementary matrices that reduce \mathbf{A} and \mathbf{B} into their reduced row echelon forms \mathbf{R}_1 and \mathbf{R}_2 (1.1.6.3) and (1.1.6.4) imply

$$\mathbf{R}_1\mathbf{x} = \mathbf{0} \quad (1.1.6.5)$$

$$\mathbf{R}_2\mathbf{y} = \mathbf{0} \quad (1.1.6.6)$$

Given that they have same solution, we can write

$$\mathbf{R}_1\mathbf{x} = \mathbf{0} \quad (1.1.6.7)$$

$$\mathbf{R}_2\mathbf{x} = \mathbf{0} \quad (1.1.6.8)$$

$$\implies (\mathbf{R}_1 - \mathbf{R}_2)\mathbf{x} = \mathbf{0} \quad (1.1.6.9)$$

Note that for a solution to exist, \mathbf{R}_1 and \mathbf{R}_2 can be either of matrices

$$\begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} \text{ or } \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} \quad (1.1.6.10)$$

Case 1 Let us assume that the solution is unique. The unique solution is

$$\mathbf{x} = \mathbf{0} \quad (1.1.6.11)$$

Since they have the same solution, both $\mathbf{R}_1, \mathbf{R}_2$ must have their rank as 2.

So,

$$\mathbf{R}_1 = \mathbf{R}_2 = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} \quad (1.1.6.12)$$

Case 2 Let us assume that (1.1.6.3), (1.1.6.4) have infinitely many solutions

So,

$$\text{rank}(\mathbf{A}) = \text{rank}(\mathbf{B}) = 1 \quad (1.1.6.13)$$

equation (1.1.6.9) for solutions other than zero solution implies

$$\mathbf{R}_1 = \mathbf{R}_2 = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} \quad (1.1.6.14)$$

So, in both the cases, we have

$$\mathbf{R}_1 = \mathbf{R}_2 \quad (1.1.6.15)$$

$$\implies \mathbf{CA} = \mathbf{DB} \quad (1.1.6.16)$$

Since \mathbf{C}, \mathbf{D} are product of elementary matrices, they are invertible.

$$\implies \mathbf{A} = \mathbf{C}^{-1}\mathbf{DB} \quad (1.1.6.17)$$

$$\mathbf{B} = \mathbf{D}^{-1}\mathbf{CA} \quad (1.1.6.18)$$

$$\text{Let } \mathbf{C}^{-1}\mathbf{D} = \mathbf{E} \quad (1.1.6.19)$$

where \mathbf{E} is also a product of elementary matrices

(1.1.6.17) and (1.1.6.18) hence become

$$\mathbf{A} = \mathbf{EB} \quad (1.1.6.20)$$

$$\mathbf{B} = \mathbf{E}^{-1}\mathbf{A} \quad (1.1.6.21)$$

Hence the two systems of equations are equivalent.

1.1.7. Prove that each subfield of the field of complex number contains every rational number

Solution:

Complex Numbers: A complex number is a number that can be expressed in the form $a + bi$, where a and b are real numbers, and i represents the imaginary unit, satisfying the equation $i^2 = -1$. The set of complex numbers is denoted by \mathbb{C}

$$\mathbb{C} = \{(a, b) : a, b \in \mathbb{R}\} \quad (1.1.7.1)$$

Rational Numbers: A number in the form $\frac{p}{q}$, where both p and q (non-zero) are integers, is called a rational number. The set of rational numbers is denoted by \mathbb{Q} . Let \mathbb{Q} be the set of

rational numbers.

$$\mathbb{Q} = \left\{ \frac{p}{q} : p \in \mathbb{Z}, q \in \mathbb{Z}_{\neq 0} \right\} \quad (1.1.7.2)$$

Let \mathbb{C} be the field of complex numbers and given \mathbb{F} be the subfield of field of complex numbers \mathbb{C} . Since \mathbb{F} is the subfield, we could say that

$$0 \in \mathbb{F} \quad (1.1.7.3)$$

$$1 \in \mathbb{F} \quad (1.1.7.4)$$

Closed under addition: Here \mathbb{F} is closed under addition since it is subfield

$$1 + 1 = 2 \in \mathbb{F} \quad (1.1.7.5)$$

$$1 + 1 + 1 = 3 \in \mathbb{F} \quad (1.1.7.6)$$

⋮

$$1 + 1 + \cdots + 1 (p \text{ times}) = p \in \mathbb{F} \quad (1.1.7.7)$$

$$1 + 1 + \cdots + 1 (q \text{ times}) = q \in \mathbb{F} \quad (1.1.7.8)$$

By using the above property we could say that zero and other positive integers belongs to \mathbb{F} . Since p and q are integers we say,

$$p \in \mathbb{Z} \quad (1.1.7.9)$$

$$q \in \mathbb{Z} \quad (1.1.7.10)$$

Additive Inverse: Let x be the positive integer belong \mathbb{F} and by additive inverse we could say,

$$\forall x \in \mathbb{F} \quad (1.1.7.11)$$

$$(-x) \in \mathbb{F} \quad (1.1.7.12)$$

Therefore field \mathbb{F} contains every integers. Let n be a integer then,

$$n \in \mathbb{Z} \implies n \in \mathbb{F} \quad (1.1.7.13)$$

$$\mathbb{Z} \subseteq \mathbb{F} \quad (1.1.7.14)$$

Where \mathbb{Z} is subset of \mathbb{F} Multiplicative Inverse: Every element except zero in the subfield \mathbb{F} has an multiplicative inverse. From equation (1.1.7.8), since $q \in \mathbb{F}$ we could say ,

$$\frac{1}{q} \in \mathbb{F} \quad \text{and } q \neq 0 \quad (1.1.7.15)$$

Closed under multiplication: Also, \mathbb{F} is closed under multiplication and thus, from equation

(1.1.7.7) and (1.1.7.15) we get ,

$$p \cdot \frac{1}{q} \in \mathbb{F} \quad (1.1.7.16)$$

$$\implies \frac{p}{q} \in \mathbb{F} \quad (1.1.7.17)$$

where , $p \in \mathbb{Z}$ and $q \in \mathbb{Z}_{\neq 0}$ (from equation (1.1.7.3) and (1.1.7.15)) Conclusion From (1.1.7.2) and (1.1.7.17) we could say ,

$$\mathbb{Q} \subseteq \mathbb{F} \quad (1.1.7.18)$$

From equation (1.1.7.18) we could say that each subfield of the field of complex number contains every rational number

Hence Proved

1.1.8. Prove that, each field of the characteristic zero contains a copy of the rational number field.

Solution: The characteristic of a field is defined to be the smallest number of times one must use the field's multiplicative identity (1) in a sum to get the additive identity (0). If this sum never reaches the additive identity (0), then the field is said to have characteristic zero.

Let \mathbb{Q} be the rational number field. Hence,

$$0 \in \mathbb{Q} \quad [\text{Additive Identity}] \quad (1.1.8.1)$$

$$1 \in \mathbb{Q} \quad [\text{Multiplicative Identity}] \quad (1.1.8.2)$$

As addition is defined on \mathbb{Q} hence we have,

$$1 \neq 0 \quad (1.1.8.3)$$

$$1 + 1 = 2 \neq 0 \quad (1.1.8.4)$$

And so on,

$$1 + 1 + \cdots + 1 = n \neq 0 \quad (1.1.8.5)$$

From the definition of characteristic of a field and from (1.1.8.3), (1.1.8.4) and so on up-to (1.1.8.5), the rational number field, \mathbb{Q} has characteristic 0.

1.2 Matrices and Elementary Row Operations

1.2.1. Find a row-reduced matrix which is row equivalent to,

$$\mathbf{A} = \begin{pmatrix} i & -(1+i) & 0 \\ 1 & -2 & 1 \\ 1 & 2i & -1 \end{pmatrix} \quad (1.2.1.1)$$

Solution: Step 1: Performing scaling operation

to matrix \mathbf{A} as $R_1 \leftarrow \frac{1}{i}R_1$ by scaling matrix \mathbf{D}_1 given as,

$$\mathbf{D}_1 = \begin{pmatrix} \frac{1}{i} & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad (1.2.1.2)$$

$$\mathbf{D}_1\mathbf{A} = \begin{pmatrix} \frac{1}{i} & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} i & -(1+i) & 0 \\ 1 & -2 & 1 \\ 1 & 2i & -1 \end{pmatrix} \quad (1.2.1.3)$$

$$\Rightarrow \mathbf{D}_1\mathbf{A} = \begin{pmatrix} 1 & -1+i & 0 \\ 1 & -2 & 1 \\ 1 & 2i & -1 \end{pmatrix} \quad (1.2.1.4)$$

Step 2: Performing $R_2 \leftarrow R_2 - R_1$ and $R_3 \leftarrow R_3 - R_1$ given by elementary matrix $\mathbf{E}_{31}\mathbf{E}_{21}$ on equation (1.2.1.4),

$$\mathbf{E}_{31}\mathbf{E}_{21} = \begin{pmatrix} 1 & 0 & 0 \\ -1 & 1 & 0 \\ -1 & 0 & 1 \end{pmatrix} \quad (1.2.1.5)$$

$$\mathbf{E}_{31}\mathbf{E}_{21}\mathbf{D}_1\mathbf{A} = \begin{pmatrix} 1 & 0 & 0 \\ -1 & 1 & 0 \\ -1 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & -1+i & 0 \\ 1 & -2 & 1 \\ 1 & 2i & -1 \end{pmatrix} \quad (1.2.1.6)$$

$$\Rightarrow \mathbf{A}_1 = \mathbf{E}_{31}\mathbf{E}_{21}\mathbf{D}_1\mathbf{A} = \begin{pmatrix} 1 & -1+i & 0 \\ 0 & -1-i & 1 \\ 0 & 1+i & -1 \end{pmatrix} \quad (1.2.1.7)$$

Step 3: Performing $R_2 \leftarrow \frac{-1}{1+i}R_2$ given by \mathbf{D}_2 on equation (1.2.1.7),

$$\mathbf{D}_2 = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \frac{1}{2}(-1+i) & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad (1.2.1.8)$$

$$\mathbf{D}_2\mathbf{A}_1 = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \frac{1}{2}(-1+i) & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & -1+i & 0 \\ 0 & -1-i & 1 \\ 0 & 1+i & -1 \end{pmatrix} \quad (1.2.1.9)$$

$$\Rightarrow \mathbf{A}_2 = \mathbf{D}_2\mathbf{A}_1 = \begin{pmatrix} 1 & -1+i & 0 \\ 0 & 1 & \frac{1}{2}(-1+i) \\ 0 & 1+i & -1 \end{pmatrix} \quad (1.2.1.10)$$

Step 4: Performing $R_3 \leftarrow R_3 - (1+i)R_2$ given by \mathbf{E}_{32} on equation (1.2.1.10),

$$\mathbf{E}_{32} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & -(1+i) & 1 \end{pmatrix} \quad (1.2.1.11)$$

$$\mathbf{E}_{32}\mathbf{A}_2 = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & -1-i & 1 \end{pmatrix} \begin{pmatrix} 1 & -1+i & 0 \\ 0 & 1 & \frac{-1+i}{2} \\ 0 & 1+i & -1 \end{pmatrix} \quad (1.2.1.12)$$

$$\Rightarrow \mathbf{A}_3 = \mathbf{E}_{32}\mathbf{A}_2 = \begin{pmatrix} 1 & -1+i & 0 \\ 0 & 1 & \frac{-1+i}{2} \\ 0 & 0 & 1 \end{pmatrix} \quad (1.2.1.13)$$

Step 5: Performing $R_1 \leftarrow R_1 - (-1+i)R_2$ given by \mathbf{E}_{12} on equation (1.2.1.13),

$$\mathbf{E}_{12} = \begin{pmatrix} 1 & 1-i & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad (1.2.1.14)$$

$$\mathbf{E}_{12}\mathbf{A}_3 = \begin{pmatrix} 1 & 1-i & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & -1+i & 0 \\ 0 & 1 & \frac{-1+i}{2} \\ 0 & 0 & 1 \end{pmatrix} \quad (1.2.1.15)$$

$$\Rightarrow \mathbf{A}_4 = \mathbf{E}_{12}\mathbf{A}_3 = \begin{pmatrix} 1 & 0 & i \\ 0 & 1 & \frac{-1+i}{2} \\ 0 & 0 & 1 \end{pmatrix} \quad (1.2.1.16)$$

Step 6: Performing $R_1 \leftarrow R_1 - iR_3$ and $R_2 \leftarrow R_2 - \frac{-1+i}{2}R_3$ given by $\mathbf{E}_{13}\mathbf{E}_{23}$ on equation (1.2.1.16),

$$\mathbf{E}_{13}\mathbf{E}_{23} = \begin{pmatrix} 1 & 0 & -i \\ 0 & 1 & -\left(\frac{-1+i}{2}\right) \\ 0 & 0 & 1 \end{pmatrix} \quad (1.2.1.17)$$

$$\mathbf{E}_{13}\mathbf{E}_{23}\mathbf{A}_4 = \begin{pmatrix} 1 & 0 & -i \\ 0 & 1 & -\left(\frac{-1+i}{2}\right) \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 & i \\ 0 & 1 & \frac{-1+i}{2} \\ 0 & 0 & 1 \end{pmatrix} \quad (1.2.1.18)$$

$$\Rightarrow \mathbf{A}_5 = \mathbf{E}_{13}\mathbf{E}_{23}\mathbf{A}_4 = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad (1.2.1.19)$$

\therefore Row-reduced matrix of \mathbf{A} given by equation (1.2.1.1) is,

$$\mathbf{A} = \begin{pmatrix} i & -1-i & 0 \\ 1 & -2 & 1 \\ 1 & 2i & -1 \end{pmatrix} \xrightarrow{RREF} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} = \mathbf{I} \quad (1.2.1.20)$$

1.2.2. Prove that the following two matrices are not row equivalent

$$\begin{pmatrix} 2 & 0 & 0 \\ a & -1 & 0 \\ b & c & 3 \end{pmatrix}, \begin{pmatrix} 1 & 1 & 2 \\ -2 & 0 & -1 \\ 1 & 3 & 5 \end{pmatrix} \quad (1.2.2.1)$$

Solution: Call the first matrix \mathbf{A} and the second matrix \mathbf{B} .

$$\mathbf{A}^T = \begin{pmatrix} 2 & a & b \\ 0 & -1 & c \\ 0 & 0 & 3 \end{pmatrix} \quad (1.2.2.2)$$

\mathbf{A}^T is a upper triangular matrix with non-zero diagonal. Hence it has full rank = 3.

$$\mathbf{B}^T = \begin{pmatrix} 1 & -2 & 1 \\ 1 & 0 & 3 \\ 2 & -1 & 5 \end{pmatrix} \xrightarrow[R_3 \rightarrow R_3 - 2R_1]{R_2 \rightarrow R_2 - R_1} \begin{pmatrix} 1 & -2 & 1 \\ 0 & 2 & 2 \\ 0 & 3 & 3 \end{pmatrix} \quad (1.2.2.3)$$

$$\xrightarrow[R_2 \leftarrow R_2/2]{R_3 \leftarrow R_3/3} \begin{pmatrix} 1 & -2 & 1 \\ 0 & 1 & 1 \\ 0 & 1 & 1 \end{pmatrix} \quad (1.2.2.4)$$

$$\xrightarrow{R_3 \leftarrow R_3 - R_2} \begin{pmatrix} 1 & -2 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \end{pmatrix} \quad (1.2.2.5)$$

\mathbf{B}^T is a upper triangular matrix with zero diagonal. Hence it doesn't have full rank. Therefore both matrices have different rank, so it cannot be row equivalent.

1.2.3. Let

$$\mathbf{A} = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \quad (1.2.3.1)$$

be a 2×2 matrix with complex entries. Suppose \mathbf{A} is row-reduced and also that $a+b+c+d=0$. Prove that there are exactly three such matrices.

Solution: A matrix is in row echelon form if it follows the following conditions

1. All nonzero rows are above any rows of all

zeros.

2. Each leading entry (i.e. left most nonzero entry) of a row is in a column to the right of the leading entry of the row above it.

3. All entries in a column below a leading entry are zero Row Reduced Echelon Form A matrix is in row reduced echelon form if it follows the following conditions

1. The matrix should be row echelon form

2. The leading entry in each nonzero row is 1.

3. Each leading 1 is the only nonzero entry in its column. Proof

Given ,

$$\mathbf{A} = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \quad (1.2.3.2)$$

Condition 1 : Matrix \mathbf{A} should be in row-reduced echelon form

Condition 2 : $a+b+c+d=0$ where a,b,c and d are the elements of the matrix \mathbf{A}

Reducing the matrix \mathbf{A} from equation (1.2.3.2)

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix} \xrightarrow{R_1 = \frac{1}{a}R_1} \begin{pmatrix} 1 & \frac{b}{a} \\ c & d \end{pmatrix} \quad (1.2.3.3)$$

$$\xrightarrow{R_2 = R_2 - cR_1} \begin{pmatrix} 1 & \frac{b}{a} \\ 0 & \frac{ad-bc}{a} \end{pmatrix} \quad (1.2.3.4)$$

$$\xrightarrow{R_2 = \frac{a}{ad-bc}R_2} \begin{pmatrix} 1 & \frac{b}{a} \\ 0 & 1 \end{pmatrix} \quad (1.2.3.5)$$

$$\xrightarrow{R_1 = R_1 - \frac{b}{a}R_2} \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} \quad (1.2.3.6)$$

Case 1: Matrix \mathbf{A} of Rank 2

From the equation (1.2.3.4), for the matrix to be in row reduced echelon form,

$$b = 0$$

$$a \neq 0$$

$$d = 1$$

$$\mathbf{A} = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} \quad (1.2.3.7)$$

For the condition 2 to get satisfied,

$$a + 0 + c + 1 = 0 \quad (1.2.3.8)$$

$$\implies a = -(c + 1) \quad (1.2.3.9)$$

$$\implies c \neq -1 \quad (1.2.3.10)$$

Both the condition gets satisfied and so exactly one matrix \mathbf{A} can be formed of Rank 2 with given conditions

Case 2: Matrix A of Rank 1

From the equation (1.2.3.4), for the matrix to be in row reduced echelon form,

$$a \neq 0$$

$$d = 0$$

$$c = 0$$

For the condition 2 to get satisfied,

$$a + b + 0 + 0 = 0 \quad (1.2.3.11)$$

$$\implies b = -a \quad (1.2.3.12)$$

$$\mathbf{A} = \begin{pmatrix} 1 & -1 \\ 0 & 0 \end{pmatrix} \quad (1.2.3.13)$$

Both the condition gets satisfied and so exactly one matrix A can be formed of Rank 1 with given conditions

Case 3: Matrix A of Rank 0

From equation (1.2.3.2), for the matrix to be in row reduced echelon form,

$$a = 0$$

$$b = 0$$

$$c = 0$$

$$d = 0$$

$$\mathbf{A} = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix} \quad (1.2.3.14)$$

Both the condition gets satisfied and so exactly one matrix A can be formed of Rank 0 with given conditions

Therefore matrix A shown in equation (1.2.3.7), (1.2.3.13) and (1.2.3.14) are the exactly three such matrices that can be formed with given conditions.

1.2.4. Prove that the interchange of two rows of a matrix can be accomplished by a finite sequence of elementary row operations of the other two types.

Solution: Let A be a 3×3 matrix with having row vectors $\mathbf{a}_1, \mathbf{a}_2$ and \mathbf{a}_3 .

$$\mathbf{A} = \begin{pmatrix} \mathbf{a}_1 \\ \mathbf{a}_2 \\ \mathbf{a}_3 \end{pmatrix} \quad (1.2.4.1)$$

Let's exchange row \mathbf{a}_1 and \mathbf{a}_2 . Let's call this

elementary operation \mathbf{E}_1 .

$$\mathbf{E}_1 = \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad (1.2.4.2)$$

$$(1.2.4.3)$$

Now performing operation \mathbf{E}_1

$$\begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \mathbf{a}_1 \\ \mathbf{a}_2 \\ \mathbf{a}_3 \end{pmatrix} = \begin{pmatrix} \mathbf{a}_2 \\ \mathbf{a}_1 \\ \mathbf{a}_3 \end{pmatrix} \quad (1.2.4.4)$$

Now, to prove that same matrix can be obtained by elementary operations let's call them \mathbf{E}_2 and \mathbf{E}_3 . Now performing operation \mathbf{E}_2 by adding row 2 to row 1.

$$\begin{pmatrix} 1 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \mathbf{a}_1 \\ \mathbf{a}_2 \\ \mathbf{a}_3 \end{pmatrix} = \begin{pmatrix} \mathbf{a}_1 + \mathbf{a}_2 \\ \mathbf{a}_2 \\ \mathbf{a}_3 \end{pmatrix} \quad (1.2.4.5)$$

Using elementary operation \mathbf{E}_2 we will subtract row 1 from row 2.

$$\begin{pmatrix} 1 & 0 & 0 \\ -1 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \mathbf{a}_1 + \mathbf{a}_2 \\ \mathbf{a}_2 \\ \mathbf{a}_3 \end{pmatrix} = \begin{pmatrix} \mathbf{a}_1 + \mathbf{a}_2 \\ -\mathbf{a}_1 \\ \mathbf{a}_3 \end{pmatrix} \quad (1.2.4.6)$$

Using elementary operation \mathbf{E}_2 we will add row 2 to row 1.

$$\begin{pmatrix} 1 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \mathbf{a}_1 + \mathbf{a}_2 \\ -\mathbf{a}_1 \\ \mathbf{a}_3 \end{pmatrix} = \begin{pmatrix} \mathbf{a}_2 \\ -\mathbf{a}_1 \\ \mathbf{a}_3 \end{pmatrix} \quad (1.2.4.7)$$

Using elementary operation \mathbf{E}_3 we will multiply row 2 by -1.

$$\begin{pmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \mathbf{a}_2 \\ -\mathbf{a}_1 \\ \mathbf{a}_3 \end{pmatrix} = \begin{pmatrix} \mathbf{a}_2 \\ \mathbf{a}_1 \\ \mathbf{a}_3 \end{pmatrix} \quad (1.2.4.8)$$

Hence, we can say that,

$$\begin{pmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 & 0 \\ -1 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \mathbf{a}_1 \\ \mathbf{a}_2 \\ \mathbf{a}_3 \end{pmatrix} = \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \mathbf{a}_1 \\ \mathbf{a}_2 \\ \mathbf{a}_3 \end{pmatrix} \quad (1.2.4.9)$$

Let us assume a matrix \mathbf{A}

$$\mathbf{A} = \begin{pmatrix} 1 & 2 & 3 \\ 0 & 1 & 0 \\ 1 & 1 & 0 \end{pmatrix} \quad (1.2.4.10)$$

Let's exchange row \mathbf{a}_1 and \mathbf{a}_2 by applying operation \mathbf{E}_1 .

$$\begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 2 & 3 \\ 0 & 1 & 0 \\ 1 & 1 & 0 \end{pmatrix} = \begin{pmatrix} 0 & 1 & 0 \\ 1 & 2 & 3 \\ 1 & 1 & 0 \end{pmatrix} \quad (1.2.4.11)$$

Now, to prove that same matrix can be obtained by other two elementary operations. We will first perform elementary operation \mathbf{E}_2 by adding row 2 to row 1.

$$\begin{pmatrix} 1 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 2 & 3 \\ 0 & 1 & 0 \\ 1 & 1 & 0 \end{pmatrix} = \begin{pmatrix} 1 & 3 & 3 \\ 0 & 1 & 0 \\ 1 & 1 & 0 \end{pmatrix} \quad (1.2.4.12)$$

Using elementary operation \mathbf{E}_2 we will subtract row 1 from row 2.

$$\begin{pmatrix} 1 & 0 & 0 \\ -1 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 3 & 3 \\ 0 & 1 & 0 \\ 1 & 1 & 0 \end{pmatrix} = \begin{pmatrix} 1 & 3 & 3 \\ -1 & -2 & -3 \\ 1 & 1 & 0 \end{pmatrix} \quad (1.2.4.13)$$

Using elementary operation \mathbf{E}_2 we will add row 2 to row 1.

$$\begin{pmatrix} 1 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 3 & 3 \\ -1 & -2 & -3 \\ 1 & 1 & 0 \end{pmatrix} = \begin{pmatrix} 0 & 1 & 0 \\ -1 & -2 & -3 \\ 1 & 1 & 0 \end{pmatrix} \quad (1.2.4.14)$$

Using elementary operation \mathbf{E}_3 we will multiply row 2 by -1.

$$\begin{pmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 0 & 1 & 0 \\ -1 & -2 & -3 \\ 1 & 1 & 0 \end{pmatrix} = \begin{pmatrix} 0 & 1 & 0 \\ 1 & 2 & 3 \\ 1 & 1 & 0 \end{pmatrix} \quad (1.2.4.15)$$

Hence, we can say that,

$$\begin{pmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 & 0 \\ -1 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \\ \times \begin{pmatrix} 1 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 2 & 3 \\ 0 & 1 & 0 \\ 1 & 1 & 0 \end{pmatrix} = \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 2 & 3 \\ 0 & 1 & 0 \\ 1 & 1 & 0 \end{pmatrix} \quad (1.2.4.16)$$

1.2.5. Consider the system of equations $\mathbf{AX} = 0$

where

$$\mathbf{A} = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$$

is a 2×2 matrix over the field F . Prove the following -

- If every entry of \mathbf{A} is 0, then every pair x_1 and x_2 is a solution of $\mathbf{AX} = 0$.
- If $ad - bc \neq 0$, then the system $\mathbf{AX} = 0$ has only the trivial solution $x_1 = x_2 = 0$
- If $ad - bc = 0$ and some entry of \mathbf{A} is different from 0, then there is a solution x_1^0 and x_2^0 such that x_1 and x_2 is a solution if and only if there is a scalar y such that $x_1 = yx_1^0$ and $x_2 = yx_2^0$

Solution: Solution 1 If every entry of \mathbf{A} is 0 then the equation $\mathbf{AX} = 0$ becomes,

$$\begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = 0 \quad (1.2.5.1)$$

$$\implies 0.x_1 + 0.x_2 = 0 \quad \forall x_1, x_2 \in F \quad (1.2.5.2)$$

Hence proved, every pair x_1 and x_2 is a solution for the equation $\mathbf{AX} = 0$. Solution 2 **Case 1:** Let $a = 0$. Since $ad - bc \neq 0$. As $bc \neq 0$ therefore $b \neq 0$ and $c \neq 0$. Hence, we can perform row reduction on the augmented matrix of equation $\mathbf{AX}=0$ as follows,

$$\begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} 0 & b & 0 \\ c & d & 0 \end{pmatrix} = \begin{pmatrix} \frac{1}{c} & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} c & d & 0 \\ 0 & b & 0 \end{pmatrix} \quad (1.2.5.3)$$

$$= \begin{pmatrix} 1 & 0 \\ 0 & \frac{1}{b} \end{pmatrix} \begin{pmatrix} 1 & \frac{d}{c} & 0 \\ 0 & b & 0 \end{pmatrix} \quad (1.2.5.4)$$

$$= \begin{pmatrix} 1 & -\frac{d}{c} \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & \frac{d}{c} & 0 \\ 0 & b & 0 \end{pmatrix} \quad (1.2.5.5)$$

$$= \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \end{pmatrix} \quad (1.2.5.6)$$

Case 2: Let $a, b, c, d \neq 0$. Considering the following case,

$$\mathbf{AX} = \mathbf{u} \quad (1.2.5.7)$$

$$\implies \begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = \begin{pmatrix} u_1 \\ u_2 \end{pmatrix} \quad (1.2.5.8)$$

Row Reducing the augmented matrix of (1.2.5.8) we get,

$$\begin{aligned} \begin{pmatrix} \frac{1}{a} & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} a & b & u_1 \\ c & d & u_2 \end{pmatrix} &= \begin{pmatrix} 1 & 0 \\ -c & 1 \end{pmatrix} \begin{pmatrix} 1 & \frac{b}{a} & \frac{u_1}{a} \\ c & d & u_2 \end{pmatrix} \\ &\quad (1.2.5.9) \\ &= \begin{pmatrix} 1 & 0 \\ 0 & \frac{a}{ad-bc} \end{pmatrix} \begin{pmatrix} 1 & \frac{b}{a} & \frac{u_1}{a} \\ 0 & \frac{ad-bc}{a} & \frac{au_2-cu_1}{a} \end{pmatrix} \\ &\quad (1.2.5.10) \\ &= \begin{pmatrix} 1 & -\frac{b}{a} \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & \frac{b}{a} & \frac{u_1}{a} \\ 0 & 1 & \frac{au_2-cu_1}{ad-bc} \end{pmatrix} \\ &\quad (1.2.5.11) \\ &= \begin{pmatrix} 1 & 0 & \frac{du_1-bu_2}{ad-bc} \\ 0 & 1 & \frac{au_2-cu_1}{ad-bc} \end{pmatrix} \\ &\quad (1.2.5.12) \end{aligned}$$

From (1.2.5.12) we get,

$$x_1 = \frac{du_1 - bu_2}{ad - bc} \quad (1.2.5.13)$$

$$x_2 = \frac{au_2 - cu_1}{ad - bc} \quad (1.2.5.14)$$

Since $u_1 = 0$ and $u_2 = 0$ then from (1.2.5.13) and (1.2.5.14),

$$x_1 = 0 \quad (1.2.5.15)$$

$$x_2 = 0 \quad (1.2.5.16)$$

Hence we get,

$$\mathbf{x} = \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix} \quad (1.2.5.17)$$

In (1.2.5.6) and (1.2.5.17), we can see that $\mathbf{AX} = 0$ has only one trivial solution i.e $x_1 = x_2 = 0$ in all cases. Hence proved, the equation $\mathbf{AX}=0$ has only one trivial solution $x_1 = x_2 = 0$ **Solution 3 Case 1:** Let, $a \neq 0$ for \mathbf{A} . Given $ad - bc = 0$, we can perform row reduction on augmented matrix of equation $\mathbf{AX} = 0$ as follows,

$$\begin{aligned} \begin{pmatrix} \frac{1}{a} & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} a & b & 0 \\ c & d & 0 \end{pmatrix} &= \begin{pmatrix} 1 & 0 \\ -c & 1 \end{pmatrix} \begin{pmatrix} 1 & \frac{b}{a} & 0 \\ c & d & 0 \end{pmatrix} \\ &\quad (1.2.5.18) \\ &= \begin{pmatrix} 1 & \frac{b}{a} & 0 \\ 0 & 0 & 0 \end{pmatrix} \quad [\because ad - bc = 0] \\ &\quad (1.2.5.19) \end{aligned}$$

Hence from (1.2.5.19), $\mathbf{AX} = 0$ if and only if

$$x_1 = -\frac{b}{a}x_2 \quad [a \neq 0] \quad (1.2.5.20)$$

Letting $x_1^0 = -\frac{b}{a}$ and $x_2^0 = 1$ we get for $y = 1$,

$$x_1 = yx_1^0 \quad (1.2.5.21)$$

$$x_2 = yx_2^0 \quad (1.2.5.22)$$

which is a solution of the equation $\mathbf{AX} = 0$.

Case 2: Let, $b \neq 0$ for \mathbf{A} . Given $ad - bc = 0$, at first we multiply by elementary matrix to change the columns and then we can perform row reduction on augmented matrix of equation $\mathbf{AX} = 0$ as follows,

$$\begin{pmatrix} a & b & 0 \\ c & d & 0 \end{pmatrix} \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix} = \begin{pmatrix} b & a & 0 \\ d & c & 0 \end{pmatrix} \quad (1.2.5.23)$$

Hence using the result obtained from (1.2.5.19) we can conclude for (1.2.5.23), $\mathbf{AX} = 0$ if and only if

$$x_2 = -\frac{a}{b}x_1 \quad [b \neq 0] \quad (1.2.5.24)$$

Letting $x_2^0 = -\frac{a}{b}$ and $x_1^0 = 1$ we get for $y = 1$,

$$x_1 = yx_1^0 \quad (1.2.5.25)$$

$$x_2 = yx_2^0 \quad (1.2.5.26)$$

which is a solution of the equation $\mathbf{AX} = 0$.

Case 3: Let, $c \neq 0$ for \mathbf{A} . Given $ad - bc = 0$, we can perform row reduction on augmented matrix of equation $\mathbf{AX} = 0$ as follows,

$$\begin{aligned} \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} a & b & 0 \\ c & d & 0 \end{pmatrix} &= \begin{pmatrix} \frac{1}{c} & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} c & d & 0 \\ a & b & 0 \end{pmatrix} \\ &\quad (1.2.5.27) \\ &= \begin{pmatrix} 1 & 0 \\ -a & 1 \end{pmatrix} \begin{pmatrix} 1 & \frac{d}{c} & 0 \\ a & b & 0 \end{pmatrix} \\ &\quad (1.2.5.28) \\ &= \begin{pmatrix} 1 & \frac{d}{c} & 0 \\ 0 & 0 & 0 \end{pmatrix} \quad [\because ad - bc = 0] \\ &\quad (1.2.5.29) \end{aligned}$$

Hence from (1.2.5.29), $\mathbf{AX} = 0$ if and only if

$$x_1 = -\frac{d}{c}x_2 \quad [a \neq 0] \quad (1.2.5.30)$$

Letting $x_1^0 = -\frac{d}{c}$ and $x_2^0 = 1$ we get for $y = 1$,

$$x_1 = yx_1^0 \quad (1.2.5.31)$$

$$x_2 = yx_2^0 \quad (1.2.5.32)$$

which is a solution of the equation $\mathbf{AX} = 0$.

Case 4: Let, $d \neq 0$ for \mathbf{A} . Given $ad - bc = 0$,

at first we multiply by elementary matrix to change the columns and then we can perform row reduction on augmented matrix of equation $\mathbf{AX} = 0$ as follows,

$$\begin{pmatrix} a & b & 0 \\ c & d & 0 \end{pmatrix} \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix} = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} b & a & 0 \\ d & c & 0 \end{pmatrix} \quad (1.2.5.33)$$

$$= \begin{pmatrix} d & c & 0 \\ b & a & 0 \end{pmatrix} \quad (1.2.5.34)$$

Hence using the result from (1.2.5.29) we can conclude for (1.2.5.34), $\mathbf{AX} = 0$ if and only if

$$x_2 = -\frac{c}{d}x_1 \quad [a \neq 0] \quad (1.2.5.35)$$

Letting $x_2^0 = -\frac{c}{d}$ and $x_1^0 = 1$ we get for $y = 1$,

$$x_1 = yx_1^0 \quad (1.2.5.36)$$

$$x_2 = yx_2^0 \quad (1.2.5.37)$$

which is a solution of the equation $\mathbf{AX} = 0$.

1.2.6. Suppose \mathbf{R} and \mathbf{R}' are 2×3 row-reduced echelon matrices and that the system $\mathbf{RX} = 0$ and $\mathbf{R}'\mathbf{X} = 0$ have exactly the same solutions. Prove that $\mathbf{R} = \mathbf{R}'$.

Solution:

Since \mathbf{R} and \mathbf{R}' are 2×3 row-reduced echelon matrices they can be of following three types:-

- a) Suppose matrix \mathbf{R} has one non-zero row then $\mathbf{RX} = 0$ will have two free variables. Since $\mathbf{R}'\mathbf{X} = 0$ will have the exact same solution as $\mathbf{RX} = 0$, $\mathbf{R}'\mathbf{X} = 0$ will also have two free variables. Thus \mathbf{R}' have one non zero row. Now let's consider a matrix \mathbf{A} with the first row as the non-zero row \mathbf{R} and second row as the second row of \mathbf{R}' .

$$\mathbf{R} = \begin{pmatrix} 1 & a & b \\ 0 & 0 & 0 \end{pmatrix} \quad (1.2.6.1)$$

$$\mathbf{R}' = \begin{pmatrix} 1 & c & d \\ 0 & 0 & 0 \end{pmatrix} \quad (1.2.6.2)$$

$$(1.2.6.3)$$

Let \mathbf{X} satisfy

$$\mathbf{RX} = 0 \quad (1.2.6.4)$$

$$\begin{pmatrix} 1 & \mathbf{a}^T \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} = 0 \quad (1.2.6.5)$$

$$x + \mathbf{a}^T \mathbf{y} = 0 \quad (1.2.6.6)$$

where

$$\mathbf{a} = \begin{pmatrix} a \\ b \end{pmatrix} \quad (1.2.6.7)$$

$$\mathbf{R}'\mathbf{X} = 0 \quad (1.2.6.8)$$

$$\begin{pmatrix} 1 & \mathbf{b}^T \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} = 0 \quad (1.2.6.9)$$

$$x + \mathbf{b}^T \mathbf{y} = 0 \quad (1.2.6.10)$$

where

$$\mathbf{b} = \begin{pmatrix} c \\ d \end{pmatrix} \quad (1.2.6.11)$$

Subtracting (1.2.6.10) from (1.2.6.6),

$$x + \mathbf{a}^T \mathbf{y} - x - \mathbf{b}^T \mathbf{y} = 0 \quad (1.2.6.12)$$

$$(\mathbf{a}^T - \mathbf{b}^T) \mathbf{y} = 0 \quad (1.2.6.13)$$

Since \mathbf{y} is a 2×1 vector,

$$\implies y_1 \mathbf{a} - y_2 \mathbf{b} = 0 \quad (1.2.6.14)$$

Which can be written as,

$$\mathbf{a} = k\mathbf{b} \quad (1.2.6.15)$$

where, $k = \frac{y_2}{y_1}$ assuming $y_1 \neq 0$. Now, Substituting (1.2.6.15) in (1.2.6.6)

$$x + k\mathbf{b}^T \mathbf{y} = 0 \quad (1.2.6.16)$$

Comparing (1.2.6.16) with (1.2.6.10)

$$x + \mathbf{b}^T \mathbf{y} = 0 \quad (1.2.6.17)$$

$$x + k\mathbf{b}^T \mathbf{y} = 0 \quad (1.2.6.18)$$

Hence $k=1$ which means $y_1=y_2$ and from this we can say that $\mathbf{a}=\mathbf{b}$. If in the above case we take $y_1=0$ then

$$y_1 \mathbf{a} - y_2 \mathbf{b} = 0 \quad (1.2.6.19)$$

$$y_2 \mathbf{b} = 0 \quad (1.2.6.20)$$

Hence for the (1.2.6.20) to be always true \mathbf{b} should be zero. Now from (1.2.6.15) we will see that \mathbf{a} will also be 0. Hence, $\mathbf{R}=\mathbf{R}'$

- b) Let \mathbf{R} and \mathbf{R}' have all rows as non zero.

$$\mathbf{R} = \begin{pmatrix} 1 & 0 & b \\ 0 & 1 & c \end{pmatrix} \quad (1.2.6.21)$$

$$\mathbf{R}' = \begin{pmatrix} 1 & 0 & e \\ 0 & 1 & f \end{pmatrix} \quad (1.2.6.22)$$

Let \mathbf{X} satisfy

$$\mathbf{R}\mathbf{X} = 0 \quad (1.2.6.23)$$

$$\mathbf{X}^T \mathbf{R}^T = 0 \quad (1.2.6.24)$$

Here,

$$\mathbf{R} = \begin{pmatrix} \mathbf{I} & \mathbf{a} \end{pmatrix} \quad (1.2.6.25) \quad \text{1.3 Matrix Multiplication}$$

$$\mathbf{a} = \begin{pmatrix} b \\ c \end{pmatrix} \quad (1.2.6.26) \quad \text{1.3.1. Let}$$

$$\mathbf{R}^T = \begin{pmatrix} \mathbf{I} \\ \mathbf{a}^T \end{pmatrix} \quad (1.2.6.27)$$

Let,

$$\mathbf{X}^T = \begin{pmatrix} \mathbf{y}^T & z \end{pmatrix} \quad (1.2.6.28)$$

where z is a scalar constant. Now, substituting (1.2.6.28) and (1.2.6.25) in (1.2.6.24)

$$\begin{pmatrix} \mathbf{y}^T & z \end{pmatrix} \begin{pmatrix} \mathbf{I} \\ \mathbf{a}^T \end{pmatrix} = 0 \quad (1.2.6.29)$$

$$\mathbf{y}^T + z\mathbf{a}^T = 0 \quad (1.2.6.30)$$

Now for,

$$\mathbf{R}'\mathbf{X} = 0 \quad (1.2.6.31)$$

$$\mathbf{X}^T \mathbf{R}'^T = 0 \quad (1.2.6.32)$$

Here,

$$\mathbf{R}' = \begin{pmatrix} \mathbf{I} & \mathbf{b} \end{pmatrix} \quad (1.2.6.33)$$

$$\mathbf{b} = \begin{pmatrix} e \\ f \end{pmatrix} \quad (1.2.6.34)$$

Let,

$$\mathbf{X}^T = \begin{pmatrix} \mathbf{y}^T & z \end{pmatrix} \quad (1.2.6.35)$$

where z is a scalar constant. Now, substituting (1.2.6.35) and (1.2.6.33) in (1.2.6.32)

$$\begin{pmatrix} \mathbf{y}^T & z \end{pmatrix} \begin{pmatrix} \mathbf{I} \\ \mathbf{b}^T \end{pmatrix} = 0 \quad (1.2.6.36)$$

$$\mathbf{y}^T + z\mathbf{b}^T = 0 \quad (1.2.6.37)$$

Subtracting (1.2.6.37) from (1.2.6.30)

$$\mathbf{y}^T + z\mathbf{a}^T - \mathbf{y}^T - z\mathbf{b}^T = 0 \quad (1.2.6.38)$$

$$(\mathbf{a}^T - \mathbf{b}^T)z = 0 \quad (1.2.6.39)$$

$$\mathbf{a}^T = \mathbf{b}^T \quad (1.2.6.40)$$

c) Suppose matrix \mathbf{R} have all the rows as zero

then $\mathbf{R}\mathbf{X}=0$ will be satisfied for all values of \mathbf{X} . We know that $\mathbf{R}'\mathbf{X}=0$ will have the exact same solution as $\mathbf{R}\mathbf{X}=0$ then we can say that for all values of $\mathbf{X}=0$ equation $\mathbf{R}'\mathbf{X}=0$ will be satisfied. Hence, $\mathbf{R}'=\mathbf{R}=0$.

Verify directly that $A(AB) = A^2B$

Solution:

$$A^2 = \begin{pmatrix} 1 & -1 & 1 \\ 2 & 0 & 1 \\ 3 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & -1 & 1 \\ 2 & 0 & 1 \\ 3 & 0 & 1 \end{pmatrix} \quad (1.3.1.2)$$

$$A^2 = \begin{pmatrix} 2 & -1 & 1 \\ 5 & -2 & 3 \\ 6 & -3 & 4 \end{pmatrix} \quad (1.3.1.3)$$

and

$$AB = \begin{pmatrix} 1 & -1 & 1 \\ 2 & 0 & 1 \\ 3 & 0 & 1 \end{pmatrix} \begin{pmatrix} 2 & -2 \\ 1 & 3 \\ 4 & 4 \end{pmatrix} \quad (1.3.1.4)$$

$$AB = \begin{pmatrix} 5 & -1 \\ 8 & 0 \\ 10 & -2 \end{pmatrix} \quad (1.3.1.5)$$

Now RHS is

$$A^2B = \begin{pmatrix} 2 & -1 & 1 \\ 5 & -2 & 3 \\ 6 & -3 & 4 \end{pmatrix} \begin{pmatrix} 2 & -2 \\ 1 & 3 \\ 4 & 4 \end{pmatrix} \quad (1.3.1.6)$$

$$A^2B = \begin{pmatrix} 7 & -3 \\ 20 & -4 \\ 25 & -5 \end{pmatrix} \quad (1.3.1.7)$$

Now LHS is

$$A(AB) = \begin{pmatrix} 1 & -1 & 1 \\ 2 & 0 & 1 \\ 3 & 0 & 1 \end{pmatrix} \begin{pmatrix} 5 & -1 \\ 8 & 0 \\ 10 & -2 \end{pmatrix} \quad (1.3.1.8)$$

$$A(AB) = \begin{pmatrix} 7 & -3 \\ 20 & -4 \\ 25 & -5 \end{pmatrix} \quad (1.3.1.9)$$

Hence verified.

1.3.2. Let

$$\mathbf{A} = \begin{pmatrix} 3 & -6 & 2 & -1 \\ -2 & 4 & 1 & 3 \\ 0 & 0 & 1 & 1 \\ 1 & -2 & 1 & 0 \end{pmatrix} \quad (1.3.2.1)$$

For which (y_1, y_2, y_3, y_4) does the system of equations $\mathbf{AX} = \mathbf{Y}$ have a solution ? **Solution:** Given ,

$$\mathbf{AX} = \mathbf{Y} \quad (1.3.2.2)$$

$$\begin{pmatrix} 3 & -6 & 2 & -1 \\ -2 & 4 & 1 & 3 \\ 0 & 0 & 1 & 1 \\ 1 & -2 & 1 & 0 \end{pmatrix} \mathbf{X} = \begin{pmatrix} y_1 \\ y_2 \\ y_3 \\ y_4 \end{pmatrix} \quad (1.3.2.3)$$

Now we try to find the matrix \mathbf{B} such that \mathbf{BA} gives the row echelon form of matrix \mathbf{A} Here, \mathbf{B} is given by ,

$$\mathbf{B} = \begin{pmatrix} 1 & 0 & 0 & 0 \\ \frac{2}{3} & 1 & 0 & 0 \\ -\frac{2}{7} & -\frac{3}{7} & 1 & 0 \\ 0 & \frac{1}{2} & -\frac{3}{2} & 1 \end{pmatrix} \quad (1.3.2.4)$$

$$\mathbf{BA} = \begin{pmatrix} 3 & -6 & 2 & -1 \\ 0 & 0 & \frac{7}{3} & \frac{7}{3} \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix} \quad (1.3.2.5)$$

Therefore, rank of matrix \mathbf{A} is 2 Now \mathbf{B} is expressed in terms of two block matrices

$$\mathbf{B} = \begin{pmatrix} \mathbf{B}_1 \\ \mathbf{B}_2 \end{pmatrix} \quad (1.3.2.6)$$

$$\mathbf{B}_1 = \begin{pmatrix} 1 & 0 & 0 & 0 \\ \frac{2}{3} & 1 & 0 & 0 \end{pmatrix} \quad (1.3.2.7)$$

$$\mathbf{B}_2 = \begin{pmatrix} -\frac{2}{7} & -\frac{3}{7} & 1 & 0 \\ 0 & \frac{1}{2} & -\frac{3}{2} & 1 \end{pmatrix} \quad (1.3.2.8)$$

Multiplying matrix \mathbf{B} to both sides on the equation (1.3.2.2), we get ,

$$\begin{pmatrix} \mathbf{B}_1 \\ \mathbf{B}_2 \end{pmatrix} \mathbf{AX} = \begin{pmatrix} \mathbf{B}_1 \\ \mathbf{B}_2 \end{pmatrix} \mathbf{Y} \quad (1.3.2.9)$$

We know that , matrix \mathbf{A} is of rank 2 The augmented matrix of (1.3.2.9) is given by

$$\left(\begin{array}{c|c} \mathbf{B}_1\mathbf{A} & \mathbf{B}_1\mathbf{Y} \\ \mathbf{B}_2\mathbf{A} & \mathbf{B}_2\mathbf{Y} \end{array} \right) \quad (1.3.2.10)$$

$$\mathbf{B}_1\mathbf{A} = \begin{pmatrix} 3 & -6 & 2 & -1 \\ 0 & 0 & \frac{7}{3} & \frac{7}{3} \end{pmatrix} \quad (1.3.2.11)$$

$$\mathbf{B}_2\mathbf{A} = \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix} \quad (1.3.2.12)$$

Since $\mathbf{B}_2\mathbf{A}$ is zero matrix and for the given system $\mathbf{AX} = \mathbf{Y}$ to have a solution,

$$\mathbf{B}_2\mathbf{Y} = 0 \quad (1.3.2.13)$$

$$\begin{pmatrix} -\frac{2}{7} & -\frac{3}{7} & 1 & 0 \\ 0 & \frac{1}{2} & -\frac{3}{2} & 1 \end{pmatrix} \begin{pmatrix} y_1 \\ y_2 \\ y_3 \\ y_4 \end{pmatrix} = 0 \quad (1.3.2.14)$$

The augmented matrix of (1.3.2.14) is given by,

$$\left(\begin{array}{cccc|c} -\frac{2}{7} & -\frac{3}{7} & 1 & 0 & 0 \\ 0 & \frac{1}{2} & -\frac{3}{2} & 1 & 0 \end{array} \right) \quad (1.3.2.15)$$

By row reduction technique,

$$\xleftrightarrow{R_1 = -\frac{7}{2}R_1} \left(\begin{array}{cccc|c} 1 & \frac{3}{2} & -\frac{7}{2} & 0 & 0 \\ 0 & \frac{1}{2} & -\frac{3}{2} & 1 & 0 \end{array} \right) \quad (1.3.2.16)$$

$$\xleftrightarrow{R_2 = 2R_2} \left(\begin{array}{cccc|c} 1 & \frac{3}{2} & -\frac{7}{2} & 0 & 0 \\ 0 & 1 & -3 & 2 & 0 \end{array} \right) \quad (1.3.2.17)$$

$$\xleftrightarrow{R_1 = R_1 - \frac{3}{2}R_2} \left(\begin{array}{cccc|c} 1 & 0 & 1 & -3 & 0 \\ 0 & 1 & -3 & 2 & 0 \end{array} \right) \quad (1.3.2.18)$$

Equation (1.3.2.14) can be modified as ,

$$\begin{pmatrix} 1 & 0 & 1 & -3 \\ 0 & 1 & -3 & 2 \end{pmatrix} \begin{pmatrix} y_1 \\ y_2 \\ y_3 \\ y_4 \end{pmatrix} = 0 \quad (1.3.2.19)$$

Here y_3 and y_4 are free variables

If $y_3 = a$ and $y_4 = b$, then the solution to the system of equation $\mathbf{AX} = \mathbf{Y}$ is given by,

$$\begin{pmatrix} y_1 \\ y_2 \\ y_3 \\ y_4 \end{pmatrix} = a \begin{pmatrix} -1 \\ 3 \\ 1 \\ 0 \end{pmatrix} + b \begin{pmatrix} 3 \\ -2 \\ 0 \\ 1 \end{pmatrix} \quad (1.3.2.20)$$

One of the solution when $a = 1$ and $b = 2$ is given by ,

$$\begin{pmatrix} y_1 \\ y_2 \\ y_3 \\ y_4 \end{pmatrix} = \begin{pmatrix} -1 \\ 3 \\ 1 \\ 0 \end{pmatrix} + 2 \begin{pmatrix} 3 \\ -2 \\ 0 \\ 1 \end{pmatrix} \quad (1.3.2.21)$$

1.3.3. Let \mathbf{A} be an $m \times n$ matrix and \mathbf{B} be an $n \times k$ matrix. Show that the columns of $\mathbf{C} =$

\mathbf{AB} are linear combinations of columns of \mathbf{A} . If $\alpha_1, \alpha_2, \dots, \alpha_n$ are the columns of \mathbf{A} and $\gamma_1, \gamma_2, \dots, \gamma_k$ are the columns of \mathbf{C} then,

$$\gamma_j = \sum_{r=1}^n B_{rj} \alpha_r \quad (1.3.3.1)$$

Solution:

$$\mathbf{C} = \mathbf{AB} \quad (1.3.3.2)$$

$$\mathbf{C} = (\gamma_1 \ \gamma_2 \ \dots \ \gamma_k) \quad (1.3.3.3)$$

$$\mathbf{A} = (\alpha_1 \ \alpha_2 \ \dots \ \alpha_n) \quad (1.3.3.4)$$

$$\mathbf{B} = (\beta_1 \ \beta_2 \ \dots \ \beta_k) \quad (1.3.3.5)$$

$$= \begin{pmatrix} B_{11} & B_{12} & \dots & B_{1k} \\ B_{21} & B_{22} & \dots & B_{2k} \\ \vdots & \vdots & \dots & \vdots \\ B_{n1} & B_{n2} & \dots & B_{nk} \end{pmatrix} \quad (1.3.3.6)$$

By matrix multiplication, we can write

$$(\gamma_1 \ \gamma_2 \ \dots \ \gamma_k) = (\mathbf{A}\beta_1 \ \mathbf{A}\beta_2 \ \dots \ \mathbf{A}\beta_k) \quad (1.3.3.7)$$

Consider γ_1

$$\gamma_1 = \mathbf{A}\beta_1 \quad (1.3.3.8)$$

$$= (\alpha_1 \ \alpha_2 \ \dots \ \alpha_n) \begin{pmatrix} B_{11} \\ B_{21} \\ \vdots \\ B_{n1} \end{pmatrix} \quad (1.3.3.9)$$

$$= B_{11}\alpha_1 + B_{21}\alpha_2 + \dots + B_{n1}\alpha_n \quad (1.3.3.10)$$

Similarly, considering j^{th} column of \mathbf{C}

$$\gamma_j = (\alpha_1 \ \alpha_2 \ \dots \ \alpha_n) \begin{pmatrix} B_{1j} \\ B_{2j} \\ \vdots \\ B_{nj} \end{pmatrix} \quad (1.3.3.11)$$

$$= B_{1j}\alpha_1 + B_{2j}\alpha_2 + \dots + B_{nj}\alpha_n \quad (1.3.3.12)$$

$$\Rightarrow \gamma_j = \sum_{r=1}^n B_{rj} \alpha_r \quad (1.3.3.13)$$

which proves that columns of \mathbf{C} are linear combinations of columns of \mathbf{A}

1.3.4. Let \mathbf{A} and \mathbf{B} be $n \times n$ matrices such that $\mathbf{AB} = \mathbf{I}$. Prove that $\mathbf{BA} = \mathbf{I}$. **Solution:** Let $\mathbf{BX} = 0$ be a system of linear equation with n unknowns

and n equations as \mathbf{B} is $n \times n$ matrix. Hence,

$$\mathbf{BX} = 0 \quad (1.3.4.1)$$

$$\Rightarrow \mathbf{A}(\mathbf{BX}) = 0 \quad (1.3.4.2)$$

$$\Rightarrow (\mathbf{AB})\mathbf{X} = 0 \quad (1.3.4.3)$$

$$\Rightarrow \mathbf{IX} = 0 \quad [\because \mathbf{AB} = \mathbf{I}] \quad (1.3.4.4)$$

$$\Rightarrow \mathbf{X} = 0 \quad (1.3.4.5)$$

From (1.3.4.5) since $\mathbf{X} = 0$ is the only solution of (1.3.4.1), hence $\text{rank}(\mathbf{B}) = n$. Which implies all columns of \mathbf{B} are linearly independent. Hence \mathbf{B} is invertible. Therefore, every left inverse of \mathbf{B} is also a right inverse of \mathbf{B} . Hence there exists a $n \times n$ matrix \mathbf{C} such that,

$$\mathbf{BC} = \mathbf{CB} = \mathbf{I} \quad (1.3.4.6)$$

Again given that $\mathbf{AB} = \mathbf{I}$. Hence,

$$\mathbf{AB} = \mathbf{I} \quad (1.3.4.7)$$

$$\Rightarrow \mathbf{ABC} = \mathbf{C} \quad (1.3.4.8)$$

$$\Rightarrow \mathbf{A}(\mathbf{BC}) = \mathbf{C} \quad (1.3.4.9)$$

$$\Rightarrow \mathbf{A} = \mathbf{C} \quad [\because \mathbf{BC} = \mathbf{I}] \quad (1.3.4.10)$$

Hence using (1.3.4.10) and (1.3.4.6) we can write,

$$\mathbf{BA} = \mathbf{I} \quad (1.3.4.11)$$

Hence Proved.

1.4 Invertible Matrices

1.4.1. Suppose \mathbf{A} is a 2×1 matrix and \mathbf{B} is 1×2 matrix. Prove that $\mathbf{C} = \mathbf{AB}$ is non invertible.

Solution: Let's take \mathbf{A} and \mathbf{B} to be non zero vectors. Now, we know that for \mathbf{C} to be non invertible $\mathbf{Cx} = 0$ should have a non trivial solution. So,

$$\mathbf{Cx} = 0 \quad (1.4.1.1)$$

$$\Rightarrow \mathbf{ABx} = 0 \quad (1.4.1.2)$$

Here, we know that \mathbf{B} is 1×2 matrix and \mathbf{x} is 2×1 matrix then \mathbf{Bx} will result to a scalar constant k .

$$\Rightarrow \mathbf{Ak} = 0 \quad (1.4.1.3)$$

For (1.4.1.3) to be true k should be zero. We also know that \mathbf{B} is 1×2 matrix i.e. rows are less than column hence,

$$\mathbf{Bx} = 0 \quad (1.4.1.4)$$

will have a non trivial solution. Hence, using (1.4.1.3) and (1.4.1.4) we can say,

$$\mathbf{ABx} = 0 \quad (1.4.1.5)$$

will have a non trivial solution so, \mathbf{C} is non invertible.

1.4.2. Let \mathbf{A} be an $n \times n$ (square) matrix, Prove the following two statements:

- If \mathbf{A} is invertible and $\mathbf{AB} = 0$ for some $n \times n$ matrix \mathbf{B} , then $\mathbf{B} = 0$.
- If \mathbf{A} is not invertible, then there exists an $n \times n$ matrix \mathbf{B} such that $\mathbf{AB} = 0$ but $\mathbf{B} \neq 0$.

Solution:

- Given \mathbf{A} is an invertible matrix and $\mathbf{AB} = 0$ then,

$$\mathbf{AB} = 0 \quad (1.4.2.1)$$

$$\implies \mathbf{A}^{-1}(\mathbf{AB}) = 0 \quad (1.4.2.2)$$

$$\implies (\mathbf{A}^{-1}\mathbf{A})\mathbf{B} = 0 \quad (1.4.2.3)$$

$$\implies \mathbf{IB} = 0 \quad [\because \mathbf{A}^{-1}\mathbf{A} = \mathbf{I}] \quad (1.4.2.4)$$

$$\implies \mathbf{B} = 0 \quad (1.4.2.5)$$

- If \mathbf{A} is not invertible, then there exists an $n \times n$ matrix \mathbf{B} such that $\mathbf{AB} = 0$ but $\mathbf{B} \neq 0$. Since \mathbf{A} is not invertible, $\mathbf{AX} = 0$ must have a non-trivial solution. Let the non-trivial solution be,

$$\mathbf{y} = \begin{pmatrix} y_1 \\ y_2 \\ \vdots \\ y_n \end{pmatrix} \quad (1.4.2.6)$$

Let \mathbf{B} which is an $n \times n$ matrix have all its columns as \mathbf{y} .

$$\mathbf{B} = (\mathbf{y} \quad \mathbf{y} \quad \cdots \quad \mathbf{y}) \quad (1.4.2.7)$$

From equation (1.4.2.7), we can say that $\mathbf{B} \neq 0$ but $\mathbf{AB} = 0$

Is \mathbf{V} , with these operations, a vector space?

Solution: \mathbf{V} is a vector space if it satisfies all properties of the vector space. Let us consider the property of Existence of additive identity. According to Existence of additive identity, there is a unique vector $\mathbf{0}$ in \mathbf{V} called the zero vector, such that $\alpha + \mathbf{0} = \alpha$ for all α in \mathbf{V} .

Let $u = (x_1, y_1) \in \mathbf{V}$

$$\begin{aligned} u + \mathbf{0} &= (x_1, y_1) + (0, 0) \\ &= (x_1 + 0, 0) \\ &= (x_1, 0) \\ &\neq u \end{aligned} \quad (2.1.1.3)$$

From (2.1.1.3), there does not exist an additive identity for \mathbf{V} .

Hence \mathbf{V} is not a vector space.

2 VECTOR SPACES

2.1 Vector Spaces

2.1.1. Let \mathbf{V} be the set of pairs (x, y) of real numbers and let \mathbf{F} be the field of real numbers. Define

$$(x, y) + (x_1, y_1) = (x + x_1, 0) \quad (2.1.1.1)$$

$$c(x, y) = (cx, 0) \quad (2.1.1.2)$$
